

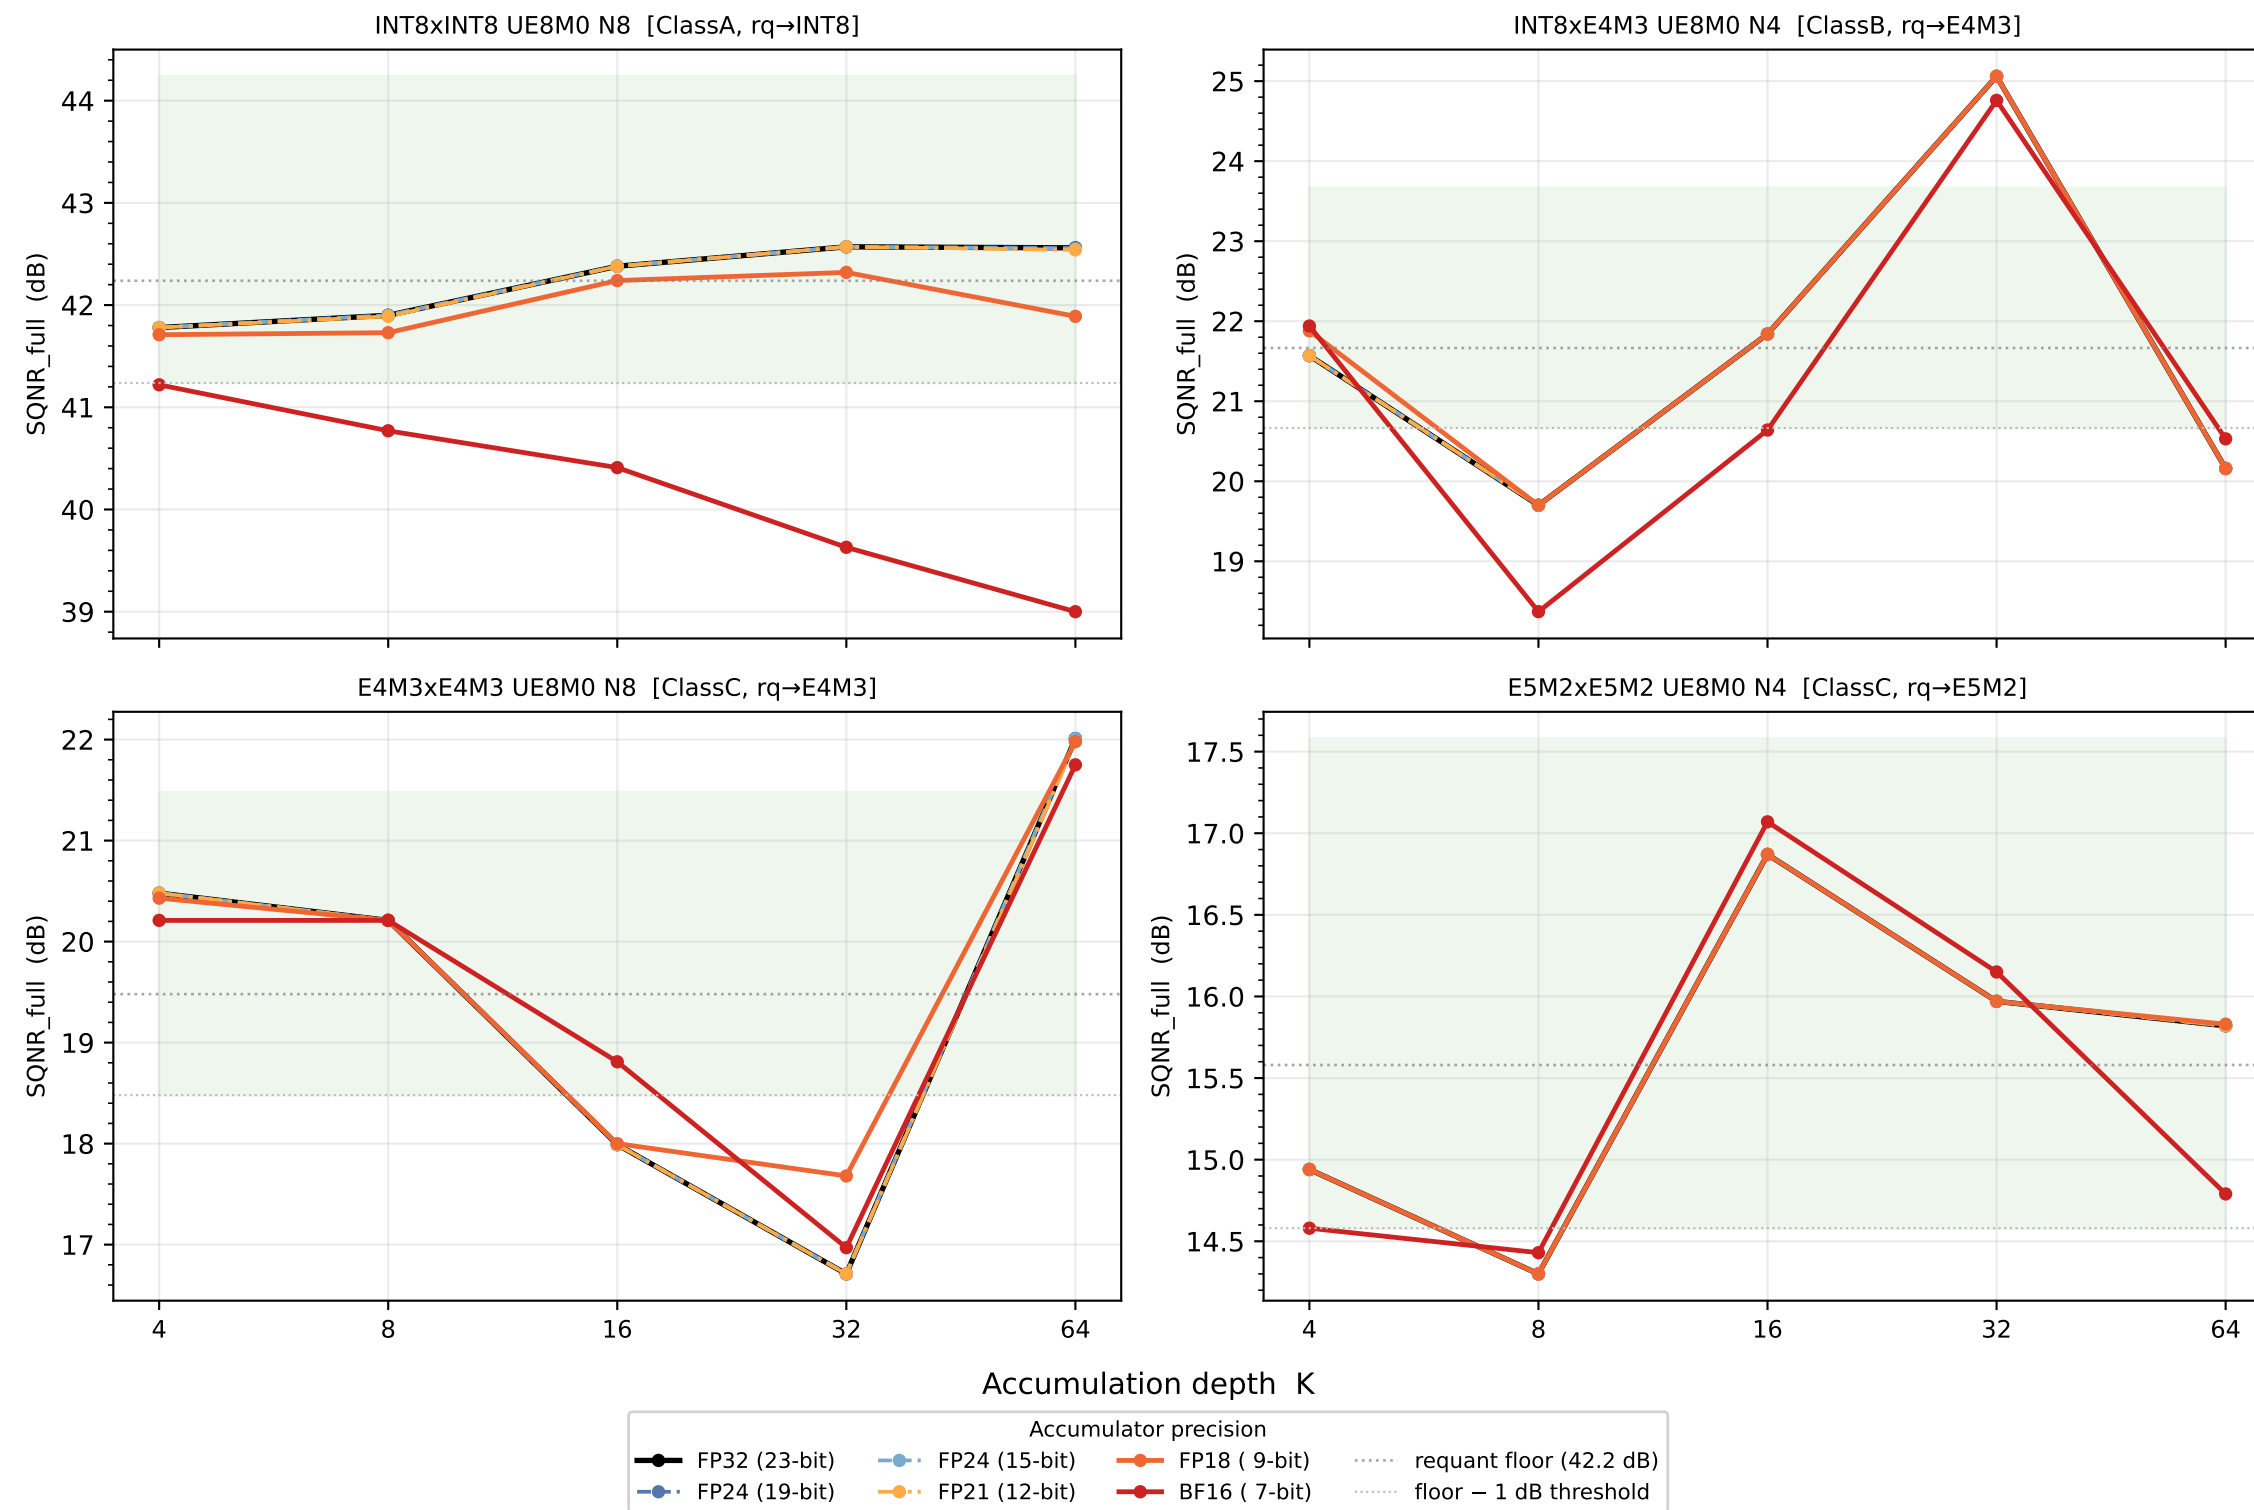

Fig 4 — Full-pipeline SQNR vs K at different accumulator precisions
(green band = within 1 dB of requant noise floor → lossless)

Note: curves within the green band are indistinguishable from FP32 accumulation after requantisation — the requant step dominates error. E5M2×E5M2 degrades at K≥16 for BF16/FP18 due to its wide productExpRange=58 (large alignment shifts amplify rounding noise). All FP8-output configs remain in the green band even at BF16 precision.
